MultiFill

Automatic refill pump for the MultiDos liquid dispenser

The MultiFill automatically refills your MultiDos container from a large storage tank. No more lifting heavy jerrycans or manually refilling on top of the feed station or milking robot, you only need to check whether the storage tank is empty.

See how the
MultiFill works here

The MultiFill

- automatically refills the MultiDos container from a storage tank
- operates fully independently using a float and pressure sensor
- makes lifting jerrycans unneccessary, which saves time
- is easy to install and use

- Fully automatic refill system for the MultiDos container
- Operates with float and pressure sensor for precise filling
- Can be placed up to 50 metres from the storage tank
- One pump for multiple MultiDos systems
- Plug and play installation
- Less lifting and time saving

Automatic Refilling Without Hassle
The MultiFill completely takes over the manual refilling of the MultiDos. As soon as the liquid in the MultiDos container drops below a set level, the self-priming pump starts and automatically refills from the storage tank. When the container is full, the pump switches off automatically. This prevents overflow and ensures you always have enough liquid for dosing.

More Convenience and Less Heavy Work
By using the MultiFill, there is no longer any need to lift heavy jerrycans or climb on top of the milking robot or feed station to refill te container. You only occasionally check the storage tank – the rest is done automatically. One MultiFill can refill multiple MultiDos systems, up to 50 metres away from the storage tank.

Plug & Play Installation
The MultiFill connects to 230V and is ready to use immediately. The flexible, transparent hose makes it easy to cherck whether the liquid is flowing. Thanks to its robust design and reliable technique, the MultiFill is a durable addition to your MultiDos system.
