ScaleUnit

Stress-free weighing during feeding

The ScaleUnit automatically weighs your cows while they are consuming concentrate feed in the feeding station. This gives you accurate, stress-free insight into the weight and weight development of your animals.

See how the **ScaleUnit** works here

The ScaleUnit

- automatically weighs cows during feeding
- fits both Walk-In and Walk-Through feeding stations
- provides real-time insight into weight and weight changes
- is a stress-free weighing solution for cows and farmers

- Voluntary and automatic weighing enabled by feed attraction
- Monitoring of growth and production
- Data accessible in the Spider App
- Cow-friendly and stress-free weighing function
- Suitable for walk-in and walk-through feeding stations
- Plug & play installation

Individual weighing for better insight
The ScaleUnit enables you to measure each cow's weight without extra handling or stress. While the cow calmly consumes her concentrate feed, the scale automatically records the current weight. This provides valuable data for monitoring growth, condition, and health.

Real-time data and analysis
The current weight is instantly displayed in the dashboard of the Spider feeding system and is accessible via smartphone, tablet, or computer. This allows you to easily track weight development and combine it with other data, such as feed intake. This makes it possible to intervene more quickly and effectively.

Stress-free and user-friendly
Because the weighing takes place during feeding, cows don't notice they are being weighed. This prevents stress and ensures reliable measurements. The ScaleUnit fits both walk-in and walk-through feeding stations and is easy to integrate into existing feeding stations.
