L'port closing gate

Eating concentrates in peace

" No more stress, no more bleeding udders and the right portion of concentrates for the right cow "

- Cows are no longer forced out of the feedstation
- Compact design, fits in every shed
- Better concentrate intake
- Works on airpressure

L'port closing gate

Eating concentrates in peace

The L'port closing gate is a pneumatic closing gate designed to safely close off an out of parlour feeding box. Using the L'port closing gate ensures cows lower in rank do not get pushed away from the feeding box and every cow can eat her concentrate in peace and injuries will be reduced. This increases the calm and cow comfort in your stall.

How it works

The L-form structure of the L'port closing gate is moved up and down driven by an air pressure cylinder. Once a cow's concentrates are in the feeding trough the L'port closing gate moves down on a signal from the feed motor without a sound and closes off the entrance to the feeding box. When the concentrate supply has stopped the closing gate will move upward after an adjustable time delay.

Maximum safety

In case of power failure the L'port closing gate automatically goes up so making it impossible for the cow to get trapped in the feeding box thus putting safety first. With the L'port closing gate you use your floor space efficiently and cow traffic does not get disrupted. The closing gate can be used with any brand or type of out of parlour feeder. The rear gate of the L'port can easily be adjusted shorter or longer so the cow is always well protected.
